

Data Processing and Editing Procedures

I. Editing

Editing consists of checking responses for range, height/weight plausibility, and logical consistency. Data deemed invalid are set to missing.

1. Single Question Edits

- If the response to a question does not correspond to one of the possible responses, the response for that question is invalid and is set to missing. This can occur if the only response options for a question are “A” or “B” and the response recorded is “C”, “D”, “E”, “F”, “G”, or “H”, for example.
- If more than one response is selected for a question, the response for that question will be considered invalid and set to missing. The one exception is the race/ethnicity question, which can have multiple responses.

2. Height, Weight, and Body Mass Index (BMI) Edits

a. Height/Weight Edits:

Height is read as a three-column character variable. It is not compressed or justified by the scanning program. The possible responses for the first column range from “3” to “7” and indicate feet; the possible responses for the second and third columns range from “00” to “11” and indicate inches. The height in feet and inches is converted to height in meters using the formula below.

$$\text{Height (in m)} = [(\text{feet} \times 12) + \text{inches}] \times 0.0254 \text{ m/in}$$

- If either feet or inches is not filled in or is unreadable, then *Height* is set to missing.
- If *Height* is missing or set to missing, then *Weight* is set to missing.

Weight is read as a three-column character variable. It is not compressed or justified by the scanning program. The first column indicates 100s of pounds ranging from “0” to “3”; the second column indicates 10s of pounds and ranges from “0” to “9”; the third column indicates single pounds and ranges from “0” to “9”. The weight in pounds is then converted to weight in kilograms using the following formula:

$$\text{Weight (in kg)} = \text{Weight (in lbs)} \times 0.4536 \text{ kg/lb}$$

- If any weight-related column is left blank or is unreadable, all columns are set to missing and *Weight* is set to missing.
- If *Weight* is missing or set to missing, then *Height* is set to missing.

2005 YOUTH RISK BEHAVIOR SURVEY

b. BMI Edits:

BMI is calculated using *Height* and *Weight* in the following formula:

$$BMI = kg/m^2 = Weight (in kg) / [Height (in m)^2]$$

- If *Height* or *Weight* are missing, BMI is set to missing
- If age or sex is missing, *Height*, *Weight*, and BMI are set to missing because the biologically implausible limits (see section 2c) are based on age and sex.

c. Biologically Implausible Value Edits:

When the basic edits for BMI are complete, further edits are applied to *Height*, *Weight*, and BMI to ensure the results are biologically plausible. *Height*, *Weight*, and BMI are set to missing when an observation lies outside the following limits developed by the Division of Nutrition and Physical Activity, CDC.

Age	Males	Females
≤ 10	Weight: 13.61-90.72 kg Height: 0.94-1.68 m BMI: 11.5 –41	Weight: 13.61-90.72 kg Height: 0.94-1.73 m BMI: 11-40
11-12	Weight: 20.41-136.08 kg Height: 1.02-1.83 m BMI: 11.5-41	Weight: 15.88-136.08 kg Height: 1.02-1.83 m BMI: 11-40
13-14	Weight: 27.22-181.44 kg Height: 1.27-1.98 m BMI: 13-55	Weight: 27.22-181.44 kg Height: 1.27-1.98 m BMI: 13-55
≥ 15	Weight: 31.75-181.44 kg Height: 1.27-2.11 m BMI: 13-55	Weight: 27.22-181.44 kg Height: 1.27-1.98 m BMI: 13-55

3. Logical Consistency Edits

The majority of the edit criteria compare two questions at a time to ensure logical consistency. If responses from two questions conflict logically, both variables are set to blank. (Exception – demographic variables are not set to missing in this case, only the non-demographic variable(s).)

For modified questionnaires, there may be additional edit criteria for site-added questions. Site-added questions are only edited among themselves. If necessary, demographic variables also may be used to edit against the site-added questions. However, no other standard variables are used to cross-edit with site-added questions, maintaining the integrity of internal consistency among standard questions.

2005 YOUTH RISK BEHAVIOR SURVEY

Lists of the logical edits used for 2005 high school and middle school questionnaires follow. If the edit criteria are met, data from the questions are changed to missing, unless they are demographic questions.

4. Subversion of Records

Records are marked “subverted” under the following conditions:

When there are more than 50 total questions and if a respondent answers 20 or less questions or answers with b, c, d, e, f, g, or h 15 or more times in a row, all values except the demographic variables are set to missing.

When there are 50 or fewer total questions and if the respondent answers 15 or less questions or answers with b, c, d, e, f, g, or h 12 or more times in a row, all values except the demographic variables are set to missing.

Subverting records eliminates records that are judged too incomplete overall to be valid for analysis.

II. Calculated Variables

1. Race/Ethnicity Calculation

The race/ethnicity question is the only YRBS question that permits the selection of more than one response. It is a “check all that apply” type question. Race data are scanned as an eight-column character variable. If the respondent selected “A”, then the first column contains an “A”. If they selected “B”, then the second column contains a “B”, and so on.

The information in this variable is used to create *Race*. If the respondent selected only one response option, then *Race* is set as a number between “1” and “6” depending on the option selected. If they selected more than one response and included Hispanic, then *Race* is set to “7” indicating “Multiple – Hispanic”. If they selected more than one response and did not include Hispanic, then *Race* is set to “8” indicating “Multiple – Non-Hispanic”. If they did not select anything, then *Race* is set to missing.

Race is stored as a single column character variable. The original data are also included in the data sent to the site.

2. Percentile, Overweight, and At Risk for Becoming Overweight Calculations

Age (Q1), Sex (Q2), and BMI are used to determine *At Risk for Becoming Overweight* (QNROVWGT) and *Overweight* (QNOVWGT) status. The respondent is considered at risk for becoming overweight, and QNROVWGT is set to “1”, when BMI percentile is at or above the 85th percentile and below the 95th percentile for BMI by age and sex. The respondent is considered overweight, and QNOVWGT is set to “1”, when BMI percentile is at or above the 95th percentile for BMI by age and sex. If BMI is missing, then QNROVWGT and QNOVWGT are set to missing. QNROVWGT and QNOVWGT are mutually exclusive. The BMI percentile for age and sex (BMIPCT), QNROVWGT, and QNOVWGT variables are included in your edited data set.

New for the 2005 YRBS, the SAS Program for the CDC Growth Charts has been used to calculate BMI and BMI percentile for age and sex, and generate QNROVWGT and QNOVWGT. This program is posted on CDC’s Division of Nutrition and Physical Activity website (<http://www.cdc.gov/nccdphp/dnpa/growthcharts/sas.htm>) and is available for use by anyone who would like to regenerate the variables. Please note the units required by the SAS program are specified in the documentation available at the website referenced above. YRBS data for height are stored in meters but the program requires height in centimeters.

2005 YOUTH RISK BEHAVIOR SURVEY

3. Dichotomous Variable Calculations

There are two types of dichotomous variables - **QN#** and **QNword**. The dichotomous variables present the percent of students answering the predetermined response(s) of interest (ROI). Students answering the ROI(s) are in the numerator. The denominator is either all respondents or a subset of respondents who have indicated in the current survey they participate in a selected activity or behavior. Students must have provided valid data to be included in any dichotomous variable calculations. Therefore students with missing responses or who had their answers subverted are not included. The variables are created and added to the master datasets during editing. The variable results are presented in the summary tables and graphs in your YRBS report.

- a. **QN# Variables:** Each standard question will have a dichotomous variable. The name of the dichotomous variable corresponds to the original question number. For example, the dichotomous variable for Q10 is named QN10. The table below provides the question and response options used for each standard Q# variable and related QN# variable. The bolded responses indicate the ROIs for that question. The ROIs are set to “1” for the QN# variables; the remaining responses are set to “2” or to “missing” for the QN# variable. For the subset dichotomous variables, the response that removes the respondent from the denominator is *italicized*. The numerator and denominator are further defined below the responses. The summary text appearing in the title of the tables for each QN# variable is also listed. Site-added questions and the corresponding QN#s are not included in this document.

- b. Supplemental Dichotomous Variables:** The **QNword** variables are supplemental, dichotomous variables that are calculated based on results from one or more than one question. You will not have these supplemental variables if you modified or deleted any of the questions needed to calculate the variables. How these variables are derived, including which students are used in the numerator and denominator, and the SAS program used are detailed in the following table. The values included in the SAS programs are numbers that correspond to the original responses; 1 = A, 2 = B, etc.
